Preliminary Amdt.

NEW ABSTRACT:

Please find the following new abstract:

Abstract of the Disclosure

A piezoelectric actuator for actuating a mechanical component, having a multilayered

structure of piezoelectric layers with inner electrodes disposed between them and contacting

outer electrodes on alternating sides and the piezoelectric actuator has chamfered corners or

edges. In the region of the corners or edges, on the sides of the piezoelectric actuator on

which the inner electrodes with alternating polarities are routed to the respective outer

electrodes, the inner electrodes have a contour that makes it possible to achieve a lower field

intensity between the inner electrodes of alternating polarities in the structure of piezoelectric

layers. This is achieved by virtue of the fact that on the side that does not contact the outer

electrodes, the edge has an obtuse angle (\propto) or is rounded.
